F. TURNER

RESERVOIR PEN

Filed Dec. 31 , 1924

FR ANK TURNER, By his Attorneys,

Maldwin Wight

UNITED STATES PATENT OFFICE.

FRANK TURNER, OF LONDON, ENGLAND, ASSIGNOR TO THOMAS DE LA RUE AND COM-PANY, LIMITED, OF LONDON, ENGLAND.

RESERVOIR PEN.

Application filed December 31, 1924, Serial No. 759,109, and in Great Britain January 8, 1924.

This invention relates to reservoir pens. tudinal grooves 11, as shown, see Figures 3 improved means for shutting off the flow of ink from the ink reservoir to the nib.

A further object of the invention is to provide means by which the flow of ink from the reservoir to the nib can be accur-

ately adjusted.

In a reservoir pen constructed according 10 to this invention, the carrier for the feed bar and nib consists solely of five parts, that is to say, a bottom section, a packing, a packing securing ring, a top section and a feed box.

The valve for controlling the flow of ink is formed on the enlarged blank end of the feed box, the valve being larger than the bar of the bottom section which receives the

said feed box.

The bottom section contains the packing and the packing securing ring. The feed box passes through the bottom section and screws into the top section, which in turn 25 box has a blank end larger than the bore of the bottom section, and a side outlet.

In operation, when the two sections are rotated relatively to one another, the valve on the end of the feed box closes down on 30 the bottom section, thereby preventing the ink from entering the carrier or nib sec-

In the accompanying drawing which illustrates the invention, Figure 1 is a section showing the valve closed, Figure 2 is a similar section showing the valve open, Figure 3 is a detail plan, Figure 4 is a section on the line IV—IV, Figure 3, and Figure 5, 6 and 7 are sections showing various ures 5, 6 and 7 are sections showing various

40 details separately.

1 is a reservoir for ink, screw threaded to receive a bottom section 2. The inner end of the bottom section 2 is provided with a valve seating 3, while the outer end of the bottom section is screw threaded to receive a top section 4. The top section 4 is in turn screw threaded to receive a feed box 5. The closed position. feed box 5 is provided with a valve head 6 and with a port 7. 8 represents a packing 50 to make a fluid-tight joint between the top section 2 and the feed box 5. 9 is a securing ring by means of which the packing can be compressed.

The feed box 5 is bored out to receive a feed bar 10 which is provided with longi-

One object of this invention is to provide and 4, for supplying ink to the nib (not shown). When the feed bar 10 and nib are in position, the outer end of the feed box 5 is expanded so that its thread jams on to the 60 outer end of the top section 4 which is turned relatively to the bottom section 2; the feed box 5, the feed bar 10 and nib turn together with the said top section 4.

In Figure 1 the supply of ink from the 65 reservoir 1 is wholly shut off by the valve head 6 on the feed box 5, the only ink be-tween the valve 6 and the nib being that which is contained in the small grooves 11.

With such a construction (when the valve 70 is closed), the liability to blot is almost, if not entirely, eliminated. As the top section 4 is turned relatively to the bottom section 2, the supply of ink from the reservoir 1 to the nib is gradually increased to any desired 75 extent.

What I claim is:—

1. In a reservoir pen, the combination of screws into the bottom section. The feed a reservoir, a bottom section adapted to be attached thereto, a valve seat on said bottom 80 section and forming at least part of one end of the reservoir, a top section, rotatively mounted in said bottom section, a feed box carried by said top section, and a valve head on said feed box, the said valve head 85 being located in the reservoir and capable of shutting off entirely the flow of ink from the reservoir.

> 2. In a reservoir pen, the combination of a reservoir, a bottom section adapted to be 90 attached thereto, a valve seat integral with said bottom section and forming at least part of one end of the reservoir, a top section screwing into the bottom section, a feed box carried by the top section, and a 95 valve head on said feed box, the said valve head being located in the reservoir, the screw thread between the top and bottom sections being of such a pitch that a plurality of turns must be imparted to the valve head 100 to move it from the fully open to the fully

> 3. In a reservoir pen, a carrier for a feed bar and nib consisting solely of the following parts in combination, a bottom section, 105 a packing therein, a packing securing ring, a top section rotatively mounted in said bottom section and a feed box carried by the

top section.

4. In a reservoir pen, the combination of 110

1,610,185

attached thereto, a valve seat on said bottom section and forming at least part of one end of the reservoir, a top section rotatively mounted in said bottom section, a feed box carried by said top section, and a valve head on said feed box, the said valve head being of greater diameter than the bore of the bottom section, and located in the reservoir.

5. In a reservoir pen, the combination of a reservoir, a bottom section adapted to be attached thereto, a valve seat integral with said bottom section and forming at least part of one end of the reservoir, a top sec-15 tion screwing into the bottom section, a feed

box carried by the top section, and a valve head on said feed box, the said valve head being of greater diameter than the bore of the bottom section, and located in the reser-

a reservoir, a bottom section adapted to be voir, the screw thread between the top and 20 bottom sections being of such a pitch that a plurality of turns must be imparted to the valve head to move it from the fully open to the fully closed position.

6. In a reservoir pen, a carrier for a feed 25 bar and nib consisting solely of the following parts in combination, a bottom section, a packing therein, a packing securing ring, a top section rotatively mounted in said bottom section, and a feed box carried by the 30 top section, having a blank end forming a valve head larger than the bore of the bottom section which receives the said feed box.

In testimony that I claim the foregoing as my invention I have signed my name this 35

12th day of September, 1924.

FRANK TURNER.
